

THE SOFTWARE : "REPORTA"

Here is exactly what this software must do, broken down by user workflow and MVP features.

1. The Core Promise

Eliminate the "copy-paste-from-5-tabs-into-Excel" nightmare. The user connects their clients' marketing accounts, clicks a button, and receives a fully written, beautifully formatted, white-labeled PDF report ready to email to their client.

2. Step-by-Step User Workflow

Step A: Connect Data Sources (The Setup)

The agency owner adds a "Client" profile.

For that client, they connect OAuth integrations for:

Meta Business Suite (Facebook/Instagram Ads).

Google Analytics 4 (Website traffic).

Google Ads (Search/Display campaigns).

(MVP limit: 3-4 sources. You can add TikTok, LinkedIn, and Bing later).

The system pulls the last 30 days of data automatically.

Step B: Configure the Template (Done Once)

The user uploads their agency logo and sets brand colors.

They select which metrics to show (e.g., Spend, Impressions, Clicks, CTR, CPA, Conversions, Revenue).

They write a standard "Introduction" blurb (e.g., "Here is your monthly performance report for [Client Name]...").

Step C: Generate the Report (The Magic)

The user selects the client and clicks "Generate Report".

Backend Action 1 (Data Pull): The server hits the APIs of Meta, GA4, and Google Ads to fetch the raw numbers for the current month (and the previous month for comparison).

Backend Action 2 (Normalization): The system maps the different API outputs into a single, unified data model (e.g., spent, clicks, conversions).

Backend Action 3 (Insight Engine): The system calculates the delta (change %). Then, it sends the key metrics and deltas to an LLM (OpenAI/Claude) with a strict prompt:

"You are a senior marketing analyst. Given this data, write a 4-sentence executive summary. Highlight the biggest win and the biggest area of concern. Do not hallucinate numbers. Be objective."

Backend Action 4 (Rendering): The system stitches the logo, the tables, the charts (generated via a charting library), and the AI summary into a polished PDF file.

Step D: Review & Send

The user opens the generated PDF in a preview pane. They can edit the AI-written summary if they want (to add personal context).

They click "Send to Client" (which emails the PDF directly) or "Download PDF" to attach it manually.

3. The MVP Scope (Build this in 6–8 weeks)

Do NOT build a dashboard (let clients log in to see data) in the MVP. Dashboards are complex and kill the "finished product" feel. Focus entirely on the generated document.

The Minimum Viable Product must include:

User Authentication (Sign-up/Login with Stripe payment).

Connection Wizard: OAuth flow for Meta, GA4, and Google Ads.

Client Management: A simple CRUD to add clients and assign API connections to them.

Template Builder:

Logo uploader.

Toggle switches for 10 standard metrics (Impressions, Clicks, Spend, CTR, CPC, Conversions, Conversion Rate, Cost per Conversion, Revenue, ROAS).

The Generator:

A "Generate Report" button.

A progress bar (Pulling data... Analyzing trends... Building PDF...).

AI Narrative: Integration with OpenAI API to generate the "Executive Summary" and a "Key Metrics at a Glance" section.

Export: PDF download with professional styling (using React-PDF, Puppeteer, or similar).

4. Defensible Edge (Why you beat the competition)

Existing tools (AgencyAnalytics/DashThis) give the client a confusing login dashboard. You are giving the agency a finished report. The agency doesn't have to do any formatting or writing; they just review and send.

Price: You are targeting the freelancer/small agency who cannot afford \$100+/mo. You launch at \$29/month for 5 clients.
